

# Report of the

# Study for Life Extension Works of Estonian Icebreakers

"The sole responsibility of this publication lies with the author. The European Union is not responsible for any use that may be made of the information contained therein."

#### INTRODUCTION

With a view to using the icebreaker TARMO and the multi-purpose vessel EVA-316 for another 15 years, the Estonian Maritime Administration entered into a contract with SRC GROUP to perform technical evaluation of the two ships, evaluate their compliance with current requirements and prepare a feasibility study. The report by SRC GROUP summarises the possible technical risks that can have an impact on the performance of the vessels while working and brings out the approximate costs of the possible extension of the life span of both ships. This document is a summary of the report and brings out only the main findings. The report itself is available in the Estonian language.

| Name of ship         | EVA 316  |
|----------------------|--|
| Type of ship         | Multi-purpose  |
| Flag                 | Estonian   |
| Port of registry     | Tallinn  |
| MMSI                 | 276415000  |
| Call                 | ESTF   |
| IMO number           | 7917977  |
| MMSI number          | 276415000  |
| Operating region     | The Baltic Sea A1                                    |
| Year of construction | 1980, conversion in 2006 by BLRT                     |
| Length max           | 59, 90 m   |
| Width                | 12, 20 m   |
| Gross tonnage        | 909  |
| Summer DWT           | 276 tonnes   |
| Class notation       | None, technical supervision carried out by the state |
| Last docking         | September 2015                                       |
| Machinery            |  |
| Main generators      | 3 x Caterpillar 3516B, 1717 kW                       |
| Propulsion devices   | 2 x RR Ulstein Aquamaster, 2100 kW                   |
| Thruster             | 1 x Jastram BU 20F 140kW                             |
| Auxiliary generators | 1 x Caterpillar Model 7.1, 129kW                     |

# <u>EVA-316</u>

#### Task:

The consulting company evaluated the current technical condition of the vessel and its compliance with contemporary requirements, taking into consideration the specifics of icebreaking. The objective was to give an opinion about the expected life span of the vessel and list the necessary works required in order to ensure that the vessel is operational 120 days per year for the next 15 years.

The approximate costs given in the report are based on the expert opinion and experience of the inspectors and their calculations, relying on the suppliers' estimates regarding the price of equipment.

#### Activities:

The multi-purpose vessel EVA-316 was inspected by way of observation while the vessel was berthed at the quay at Hundipea harbour, Tallinn, from July to October 2017, by Kristjan Valle, Toomas Hüüdma and Valmar Sink. During three visits, the technical condition of the vessel was evaluated and the crew were interviewed (18.08., 25.09., 04.10.). Also meetings with the Maritime Administration's Fleet

Department specialists were organised. In addition, all available documentation and reports on the repairs that have been carried out were studied.

During the abovenamed inspections, the shipboard installations and machinery were not working, and detection of technical defects was not carried out.

# Findings:

In general, the ship's hull and machinery are in good condition. The vessel is not in particularly intensive use. It is the experts' opinion that without significant investments it can be used for the next five years.

International requirements and rules (SOLAS, MARPOL, etc.) for the existing ships are constantly changed and amended, and those rules have not been introduced on this vessel. It is estimated that in order to achieve compliance with the current SOLAS and MARPOL requirements investments in the amount of approximately 184,000 euro are needed (works relating to fire safety).

There are no big problems with the machinery and shipboard installations because those are all relatively new devices, but it is essential to draw up a maintenance plan to ensure smooth operation. All devices on deck are in good condition and no investments are required to replace or repair those; regular maintenance will be sufficient. Navigational and radiocommunication equipment is in good working order.

## **Recommendations:**

While assessing the operation of the ship and possible expenses in the next 15 years it must be taken into account that presumably the ship is used 120 days per year. Considering the minimal hours of work, the benefits of replacing the existing installations and equipment with new ones must be carefully considered and weighed against the likely costs, as there may be no imminent need for replacement.

The renewal of the central ventilation system together with the installation of an air conditioner would improve significantly the working and living conditions of the crew; it would also modernise the system and ensure its compliance with the current requirements. The estimated cost would be 240,000 euro.

The estimates in the following table are approximate and the figures may vary 10 to 15 per cent due to changes in prices, the time of carrying out the required works and the necessity of unforeseen repairs.

|      |                                | Immediate  |              | Investment |
|------|--------------------------------|------------|--------------|------------|
| No.  | Item                           | investment | If necessary | for 15 yrs |
| 1.   | General                        |            |              |            |
| 2.   | Hull and decks of the vessel   |            |              | 30,000     |
| 2.1. | Repairs of the hull - frame 62 |            |              | 30,000     |
| 3.   | Machinery on the deck          |            |              | 56,000     |
| 3.1. | Anchor cables                  |            |              | 28,000     |
| 3.2. | LAMOR                          |            |              | 28,000     |

#### TABLE 1 Estimated investment costs for EVA-316

| 4.   | Navigation, GMDSS                                     |       |        | 175,000 |
|------|---|-------|--------|---------|
| 4.1. | GMDSS A2 equipment                                    |       |        | 30,000  |
| 4.2. | Radar S-Band  |       |        | 30,000  |
| 4.3. | Radar X-Band  |       |        | 20,000  |
| 4.4. | Modernisation of DP 0 system                          |       |        | 35,000  |
| 5.   | Propulsion system                                     |       |        | 521,800 |
| 5.1. | Geometry of two Aquamaster blades                     |       |        | 80,000  |
| 5.2. | Full maintenance of two Aquamaster propulsion devices |       |        | 116,000 |
| 5.3. | Spare parts for two Aquamaster propulsion devices     |       |        | 231,000 |
| 5.4. | Maintenance of two Aquamaster electrical motors       |       |        | 26,800  |
| 5.5. | Maintenance of Jastram BU 20 thruster                 |       |        | 68,000  |
| 6.   | Main and auxiliary generators                         | 6,000 |        | 150,000 |
| 6.1. | Testing of diesel generators (3 pcs)                  | 6,000 |        |         |
| 6.2. | Maintenance of diesel generators 12 000 h             |       |        | 150,000 |
| 7.   | Systems and auxiliary mechanisms                      | 9,000 |        | 102,400 |
| 7.1. | Atlas Copco compressors                               |       |        | 32,000  |
| 7.2. | Grundfos boiler pumps                                 |       |        | 10,000  |
| 7.3. | Repair of EVAC  |       |        | 10,800  |
| 7.4. | Hydraulic station oil cooler                          | 9,000 |        | 15,000  |
| 7.5. | Renewal of piping                                     |       |        | 20,000  |
| 7.6. | Replacement of fire pump                              |       |        | 11,800  |
| 7.7. | Improvement of sanitary system                        |       |        | 2,800   |
| 8.   | Electrical equipment                                  | 7,800 | 50,000 | 750,000 |
| 8.1. | Replacement of controllers                            |       |        |         |
| 8.2. | Replacement of inverter system                        |       | 50,000 |         |
| 8.3. | Inverter modules cooling system cleaning              | 7,800 |        |         |
| 8.4. | Replacement of main switchboard                       |       |        | 750,000 |
| 9.   | Ventilation, heating                                  |       |        | 240,000 |

| 9.1.  | Installation of central air conditioner    |        |        | 240,000   |
|-------|--|--------|--------|-----------|
| 10.   | Interior spaces, galley                    |        |        | 25,000    |
| 10.1. | Modernisation of galley ventilation system |        |        | 25,000    |
| 11.   | Isolation                                  |        |        | 16,250    |

# <u>TARMO</u>

| Name of ship          | TARMO  |
|-----------------------|--|
| Type of ship          | Icebreaker   |
| Flag                  | Estonia  |
| Port of registry      | Tallinn  |
| MMSI                  | 276158000  |
| Call                  | ESZA   |
| IMO number            | 5352886  |
| MMSI number           | 276415000  |
| Operating region      | The Baltic Sea, GMDSS A2                             |
| Year of construction  | 1963   |
| Length max            | 84,5 m   |
| Width                 | 21,2 m   |
| Gross tonnage         | 3916   |
| Summer DWT            | 1585   |
| Class notation        | None, technical supervision carried out by the state |
| Last docking          | September 2016                                       |
| Machinery             |  |
| Main engines (diesel) | 4 x Wärtsilä 8MH51; 4 x 2530 kW                      |
| Main generators       | 4 x Srömberg GTKML 155/355; 4 x (2 x 1200) kW        |
| Steering gear         | CG70/40 Type T-8981                                  |
| Propulsion motors     | Bow 2 x Strömberg GTKM 2 x (2 x 1100) kW             |
|                       | Stern 2 x Strömberg GTKM 2 x (2 x 1700) kW           |
| Auxiliary diesels     | 4 x Wärtsilä 614 T;                                  |
| Auxiliary generators  | 4 x Strömberg HSSJL II/405B2; 4 x 380V;420 kVA       |

# Task:

The consulting company evaluated the current technical condition of the vessel and its compliance with contemporary requirements, taking into consideration the specifics of icebreaking. The objective was to give an opinion about the expected life span of the vessel and list the necessary works required in order to ensure that the vessel is operational 60 days per year for the next 15 years.

The cost estimations given in the report are based on the expert opinion and experience of the inspectors and their calculations, relying on the suppliers' estimates regarding the price of equipment.

#### Activities:

The icebreaker TARMO was inspected by way of observation while the vessel was berthed at the quay at Hundipea harbour, Tallinn, from July to October 2017, by Kristjan Valle, Toomas Hüüdma and Valmar Sink. During four visits, the technical condition of the vessel was evaluated and the crew were interviewed (17.07., 17.08., 29.08., 04.10.). Also meetings with the Maritime Administration's Fleet Department specialists were organised. In addition, all available documentation and reports were studied regarding the repairs and detections of defects in mechanisms carried out during the period that the vessel has been in the Estonian ship register.

During the abovenamed inspections, the shipboard installations and machinery were not working, and detection of technical defects was not carried out.

## Findings:

International requirements and rules (SOLAS, MARPOL, etc.) for the existing ships are constantly changed and amended, and those rules have not been introduced on this vessel. The general condition of the ship is satisfactory, considering that it is used rarely. The greatest risk factor is the state of the isolation made of asbestos in the living quarters. Using asbestos on ships is prohibited today. On the existing ships where asbestos has been used, a risk analysis must be carried out and the possibility of asbestos getting in the air that is inhaled must be precluded. Such a risk analysis has not been carried out. It can be presumed that while the ship's machinery is working, particles of asbestos spread in the interior spaces. There is a considerable risk of crew members filing claims regarding permanent damage to their health.

In autumn 2017, a test was carried out during operation at seven locations in the corridors and engine spaces to determine the existence of suspended particulates of asbestos in the air, during which suspended particulates were identified in the stern engine room, but the result did not exceed the norm. We find that the number of locations for measuring the particles of asbestos in the air was too small and this result does not give an accurate overview of the actual situation. It is necessary to carry out more extensive measuring and draw up a plan for handling asbestos.

#### **Recommendations:**

While evaluating the operation of the ship and possible investments in the next 15 years it must be taken into account that presumably the ship is used 60 days per year. Considering the minimal hours of work, the benefits of replacing the existing installations and equipment with new ones must be carefully considered and weighed against the likely costs, as there may be no imminent need for replacement.

Navigational and radiocommunication equipment is in good working order. The only risk factor is the age of the equipment. For efficient icebreaking, ice searchlights must be replaced entirely. As navigational and radiocommunication equipment has been duplicated, replacement and repairs can

be carried out on an ongoing basis, as malfunctions occur. It is necessary, however, to replace the propulsion shaft stern tube seals, and in order to ensure the reliability of piping, renew the main components of important systems. There is no sewage treatment device on the vessel, so installation of such a device ought to be considered, in order to ensure compliance with environmental requirements.

The greatest risk factor of electrical equipment is its age. It must be decided whether old pipes thermal insulation renewal or installation of new propulsion motors is more feasible. An alternative to replacement of various installations is renewal of the propulsion devices, energy and control systems in their entirety – the existing diesel generators can be replaced with 4 new AC diesel generators that would produce enough energy for propulsion motors and auxiliary mechanisms. Propulsion motors should also be replaced with AC motors. Accordingly, control and alarm systems as well as navigational and radiocommunication equipment shall also be renewed.

The estimates in the following table are approximate and the figures may vary 10 to 15 per cent due to changes in prices, the time of carrying out the required works and the necessity of unforeseen repairs.

|      |  | Immediate  |              | Investment for |
|------|--|------------|--------------|----------------|
| No.  | Item   | investment | If necessary | 15 yrs         |
| 1.   | General  |            |              |                |
| 2.   | Hull and decks of the vessel                   |            | 200, 000     | 262,975        |

|       | €   | 7,500 | 11,099,000 | 36,595,325 |
|       |   |       | TOTAL      | 39,701,825 |

\*Items no. 9.1 (8,000,000 € life extension for 5 years) and 9.2 (20,000,000 € life extension for 15 years) – the shipowner can choose the suitable variant

*Note*: If the shipowner chooses the variant in 9.2, the investment for life extension of the ship will be  $39,701,825 \in .$  (36,595,325 + 11,099,000 - 8,000,000 + 7500 = 39,701,825)

If the shipowner chooses the variant in 9.1, the investment for life extension of the ship will be  $27,694,325 \in .(36,595,325 - 20,000,000 + 11,099,000 = 27,694,325)$
